

# Macroeconomic and financial market developments

September 2015

Background material  
to the abridged minutes of the  
Monetary Council meeting  
22 September 2015

Time of publication: 2 pm on 7 October 2015

*The background material 'Macroeconomic and financial market developments' is based on information available until 18 September 2015.*

*Article 3 (1) of the MNB Act (Act CXXXIX of 2013 on the Magyar Nemzeti Bank) defines achieving and maintaining price stability as the primary objective of the Magyar Nemzeti Bank. The MNB's supreme decision-making body is the Monetary Council. The Council convenes as required by circumstances, but at least twice a month, according to a pre-announced schedule. At the second scheduled meeting each month, members consider issues relevant to decisions on interest rates. Abridged minutes of the Council's rate-setting meetings are released regularly, before the next policy meeting takes place. As a summary of the analyses prepared by staff for the Monetary Council, the background material presents economic and financial market developments as well as new information which has become available since the previous meeting.*

The abridged minutes and background materials to the minutes are available on the MNB's website at:

<http://www.mnb.hu/en/monetary-policy/the-monetary-council/minutes>

## 1. MACROECONOMIC DEVELOPMENTS

### 1.1. Global macroeconomic environment

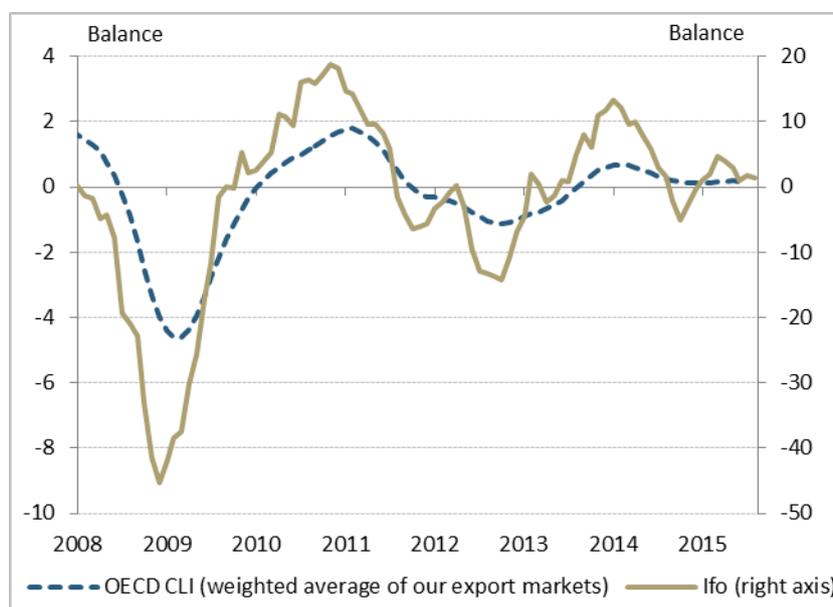

**GDP data in the second quarter of 2015 were slightly lower than expected. Based on the incoming indicators, in recent months growth in developing countries may have decelerated compared to earlier expectations. Growth remains fragile surrounded by both upside and downside risks.** The outlook for growth in the world's emerging regions is moderate compared to pre-crisis levels. Persisting geopolitical tensions may continue to restrain growth in developed countries through weaker demand and economic sanctions. Uncertainties surrounding the expected interest rate increase by the Fed may moderate investors' interest in emerging markets. Low oil prices may boost growth in oil importing economies, while having an unfavourable effect on oil exporters' growth prospects. Inflationary pressure from the world market has remained weak in recent months as a result of moderate oil prices.

**Growth in the world economy continued in the second quarter of this year.** The highest growth rates in the EU were registered in the countries of the CEE region. The adverse effect of the Russia–Ukraine conflict may have continued to impede economic growth through weaker demand and the economic sanctions extended until January 2016. In addition, based on the incoming indicators, growth in developing countries may decelerate compared to previous expectations.

**The euro area economy registered a quarter-on-quarter growth rate of 0.4 per cent in the second quarter of 2015. The monthly production data received show a moderate upturn in the economic activity of the region. Although the forward-looking indicators of economic activity imply moderately improving performance, the protracted management of the Greek situation may affect the economic performance of the euro area negatively.** In addition, the tense geopolitical situation may also have a negative impact: increasing uncertainty and bilateral economic sanctions may restrain economic activity. These factors may have contributed to the fact that economic expansion continued at a more moderate rate than in the previous quarter. Economic growth in Germany, Hungary's most important export partner, accelerated in the second quarter, but was still moderate. Domestic demand in Germany continued to grow, but external market activity may have been curbed by the Russia–Ukraine conflict and the slowdown in demand in Asia. Expectations concerning the German economy (Ifo) indicate less favourable

prospects than at the beginning of the year (Chart 1). Overall, the average increase in new orders in the German industry was modest in the past months.

*Chart 1: Indicators of activity in Hungary's export markets*

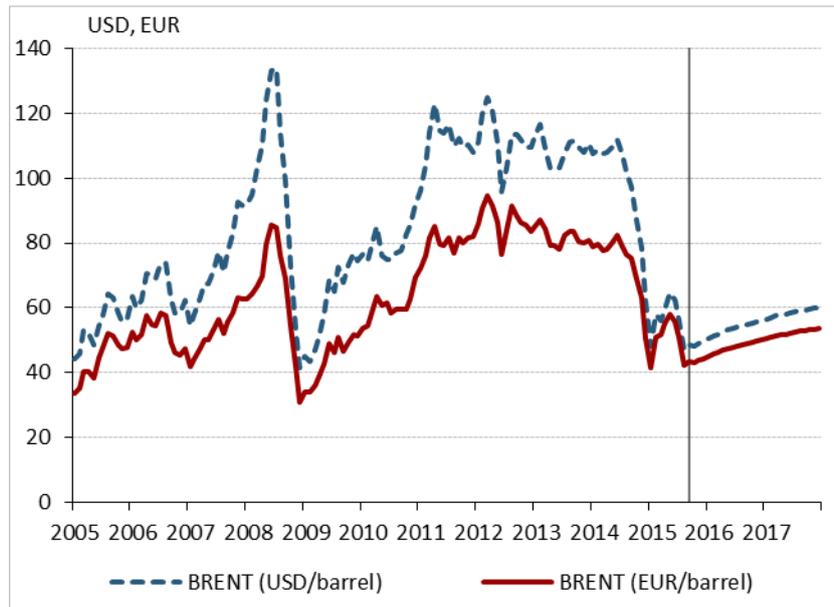

Sources: OECD, Ifo.

The performance of the region was outstanding in the second quarter of this year but, according to monthly indicators of recent months, industrial output is still fragile in the region. The negative effects of the Russia–Ukraine conflict may have had only a limited impact on growth in the CEE region so far, but looking ahead, the expected significant contraction in the Ukrainian and Russian economies may, both directly and indirectly, hinder economic growth in the region.

**Inflationary pressure from the world market remains weak.** The decline in commodity prices, combined with slowly growing world economy, are reducing inflation. As a result, inflation rates remained below target in the world's major economies (euro area inflation stood at 0.1 per cent in August). In recent weeks, oil prices continued to decrease further, which was attributable to both demand and supply factors (Chart 2) (see more details on this in subsection 2.1).

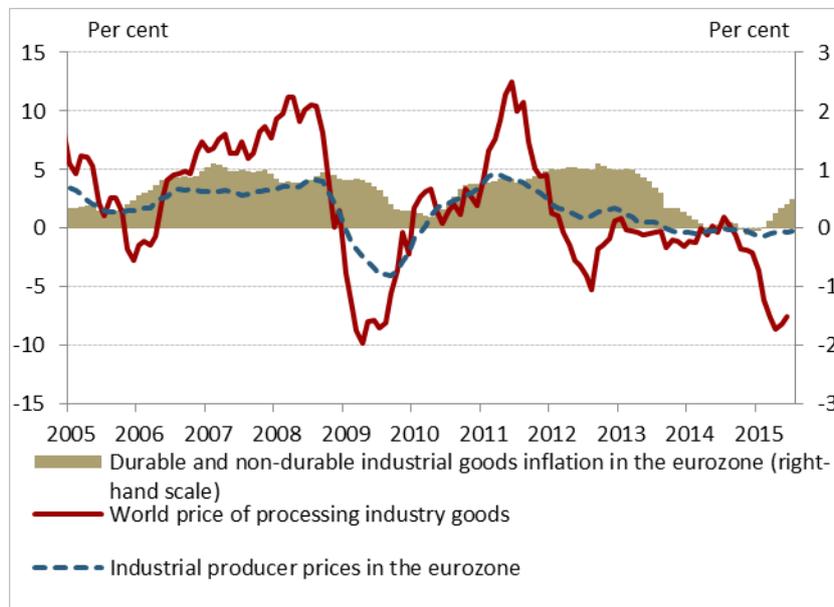

Chart 2: World market price of Brent crude oil

Source: Bloomberg.

The world market prices of industrial commodities, unprocessed food and manufactured goods continued to be extremely restrained (Chart 3).

## 1.2. Domestic real economy developments

### 1.2.1. Economic growth

The Hungarian economy continued to grow in the second quarter of 2015. According to detailed data Hungary's GDP was up 2.7 per cent year-on-year, with a 0.5 per cent growth recorded relative to the previous quarter.

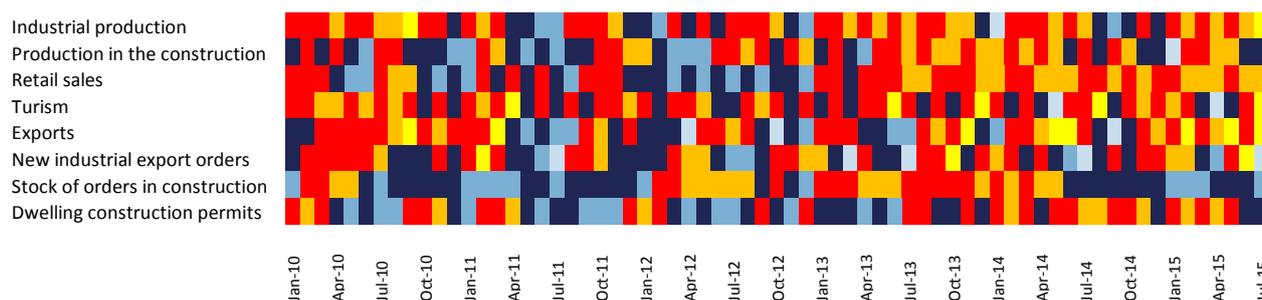

Economic growth decelerated slightly in the second quarter of this year (Chart 4). The highest year-on-year growth was observed in manufacturing and construction. Manufacturing and market services were the main contributors to GDP growth. At the same time, economic expansion was lower than in the previous quarters, which may primarily be attributable to the decline in the performance of agriculture, as due to the high base of last year's favourable harvest results the contribution of agriculture to growth was negative in the second quarter as well.

Chart 4: Changes in monthly production indicators\* and GDP

\* Weighted average of monthly production indicators (industrial output, construction output and retail sales). The weights are derived from regression explaining GDP growth. Source: MNB calculations based on CSO data.

Chart 5: Growth heat map\*

\* The growth heat map shows the three-month moving averages of the seasonally adjusted monthly growth rates of the most important monthly indicators of activity, using the following colour code: red = grows above the five-year average, at an accelerating rate; orange = grows above the average, at a slowing rate; yellow = grows below the average, at an accelerating rate; light blue = grows below the average, at a slowing rate; blue = falls at a slowing rate; dark blue = falls at an accelerating rate. Source: MNB calculations based on CSO data.

In July 2015, **industrial output rose by 3.4 per cent year on year**. Seasonally adjusted production, excluding the working day effect was **0.7 per cent down compared to the previous month**. In July, the **performance of manufacturing subsectors showed a favourable picture**. Of the major subsectors, vehicle manufacturing and food industry production increased, while output in the electronics, optical and metal industry subsectors declined compared to the previous month. The fall in output of the chemical industry was mainly attributable to the decrease in coke production and crude oil processing, which had lasted for three months. Overall, based on the forward-looking indicators, the gradual pick-up in the euro area may continue in the coming months, with possible support from lower oil prices and the loose monetary policy of the ECB. Signs of a deceleration in global economic activity and the Russia–Ukraine conflict may still pose downside risks with regard to the economic prospects of the euro area.

Expressed in euro terms, in July the value of **exports and imports increased by 5.4 per cent and 2.3 per cent, respectively, year on year**. The trade surplus significantly exceeded its value registered in July last year. Increase in export prices exceeded the dynamics of import prices, resulting in a further improvement in the terms of trade in June. The improvement may primarily be attributable to the falling oil prices.

In July 2015, **the volume of construction output rose by 0.2 per cent year on year**, while seasonally and working day adjusted **output fell by 3.0 per cent compared to the previous month**. The performance of the sector is expected to be subdued in the second half of 2015, which may be attributable both to the steady decline of nearly one year in the book of contracts

and last year's high base. Approaching the end of the 2007–2013 EU programming period, infrastructural projects financed from EU funds may be accomplished gradually in the course of the year.

**The pick-up in consumption demand observed early in the year continued in the second quarter as well.** This may be explained by the improving labour market situation and by the increase in real wages as a result of low inflation, as well as by the upswing in retail sales volumes. In July, according to preliminary data, sales volumes increased by 7.3 per cent year on year, while the increase in turnover was 0.9 per cent compared to the previous month. In July, retail sales may have increased in a wide range of products. Food sales dynamics continued to improve, and the turnover of non-food consumer durables grew markedly compared to the same period of the previous year. In accordance with the material fall in fuel prices observed in the recent period, the growth in fuel sales continued to have a material contribution to the growth in retail sales volume. Domestic sales increased at a higher rate than the average observed in the countries of the region and in the developed European countries.

**The baseline scenario of the September forecast projects the continuation of a structurally balanced economic growth. In addition to a further increase in consumption, net exports may also significantly contribute to the expansion in the economy. The economy grew by 3.6 per cent in 2014 as a whole, which may be followed by an expansion of over 3 per cent this year.** Economic growth may be supported by the recovery in domestic demand, the absorption of EU funds, loose monetary conditions and improving labour market conditions. Falling oil prices may boost growth in EU Member States, which may offset in Hungary's external demand the negative effects stemming from the deteriorating prospects of emerging markets.

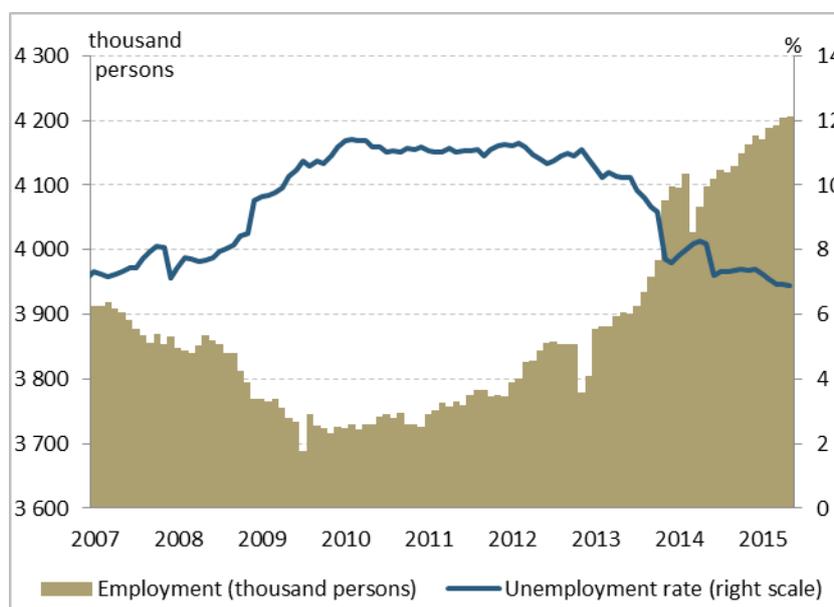

#### 1.2.2. Employment

According to Labour Force Survey data, **the number of employees in the whole economy continued to increase in July 2015.** There was no major change in activity compared to the previous month, but **the number of unemployed continued to decline** (Chart 6).

**Employment in the private sector continued to increase in the second quarter.** The number of people working in the general government grew significantly, which may have been mostly attributable to the considerable extension of public work programmes. Within the private sector

the growth in employment was primarily related to market services, whereas the number of employees in the manufacturing sector did not change notably.

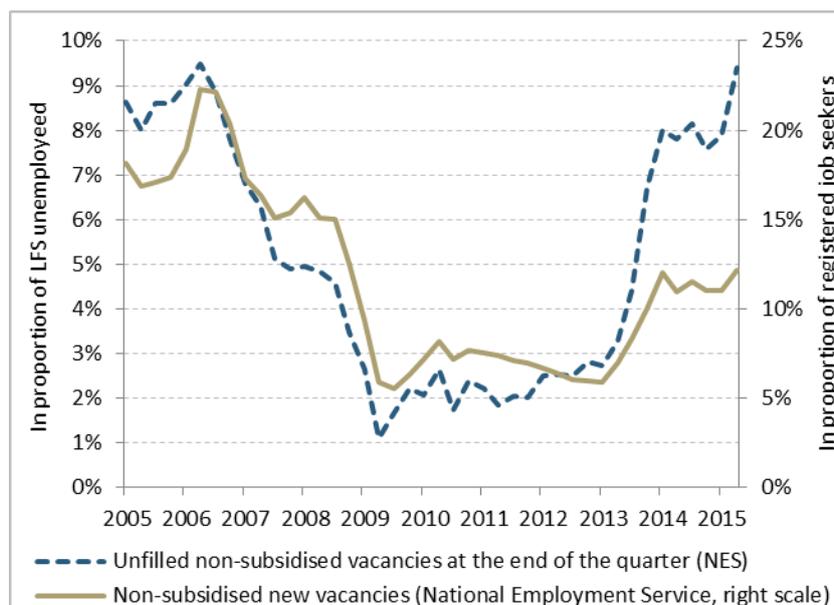

*Chart 6: Number of persons employed and the seasonally adjusted unemployment rate*

Source: HCSO.

In the second quarter, **the number of newly announced non-subsidised jobs declined slightly** compared to the previous quarter, while **the end-of-month number of vacant, non-subsidised jobs continued to increase**. The labour market has gradually become tighter since 2013. However, **there has been no major change in tightness in the recent quarters** (Chart 7).

*Chart 7: Indicators of labour market tightness*

Sources: HCSO (Labour Force Survey), National Employment Service.

### 1.3. Inflation and wages

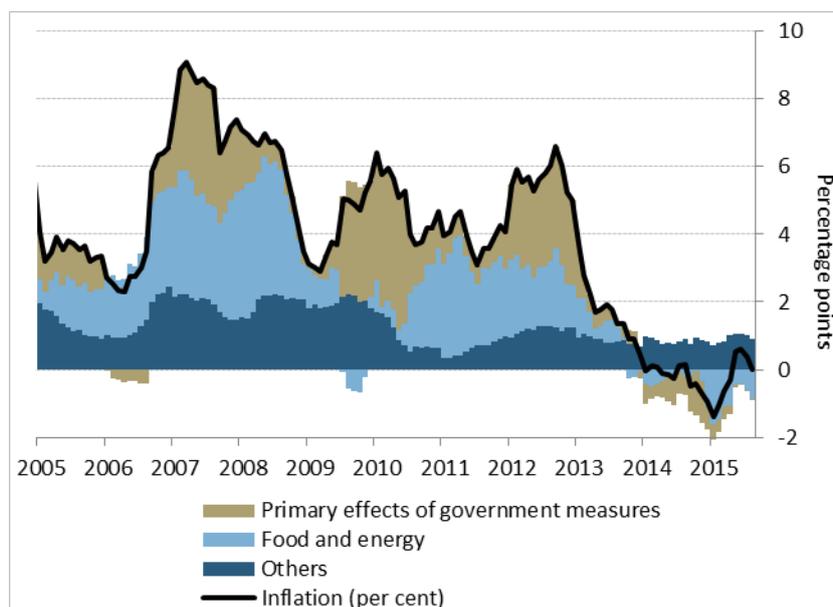

#### 1.3.1. Wages

In July, following strengthening in the previous month, annual wage dynamics in the private sector decelerated; therefore, the **increase in wages can still be considered restrained**. Within the private sector, annual wage dynamics in both manufacturing and the market services sector declined compared to the previous month. In July, **gross average earnings** in the national economy and **in the private sector increased by 3.1 per cent and 3.7 per cent, respectively, compared to the same period of the previous year.**

#### 1.3.2. Inflation developments

**In August 2015, inflation was 0.0 per cent, while core inflation was 1.2 per cent and core inflation excluding indirect taxes stood at 1.0 per cent (Chart 8).** The actual decline in inflation was attributable to the fall in fuel prices, while the slight decrease in core inflation is mainly the result of the slowdown in industrial goods inflation.

*Chart 8: Decomposition of the consumer price index*

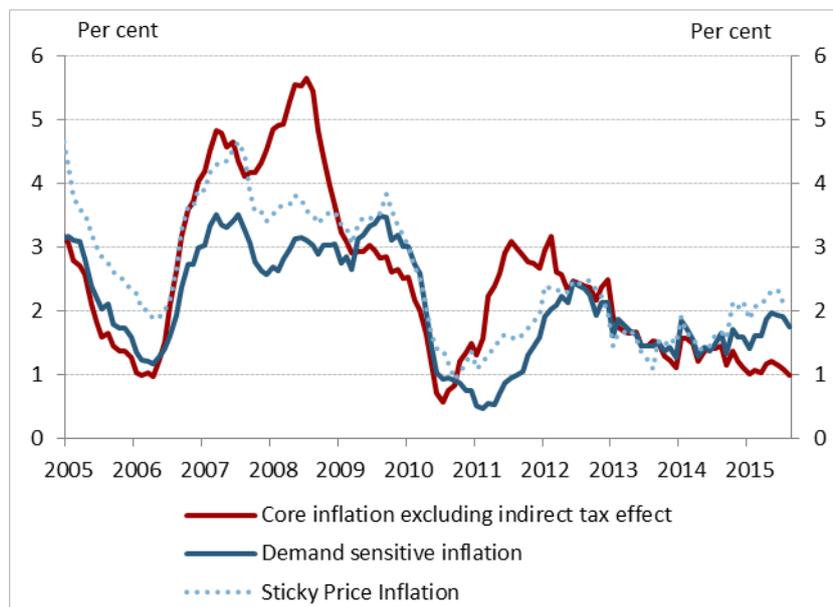

Source: MNB calculations based on CSO data.

**Underlying inflation indicators continue to point to a moderate inflation environment, which may be attributable to the low level of imported inflation, declining oil prices and the magnitude of unutilised capacities (Chart 9).** In July 2015, agricultural producer prices fell by 5.6 per cent in annual terms. The domestic sales prices of the consumer goods sectors declined by

0.3 per cent year on year. In line with retail trade data, consumption demand continued to expand during the second quarter, in parallel with the year-on-year rise in real income.

Chart 9: Measures of underlying inflation

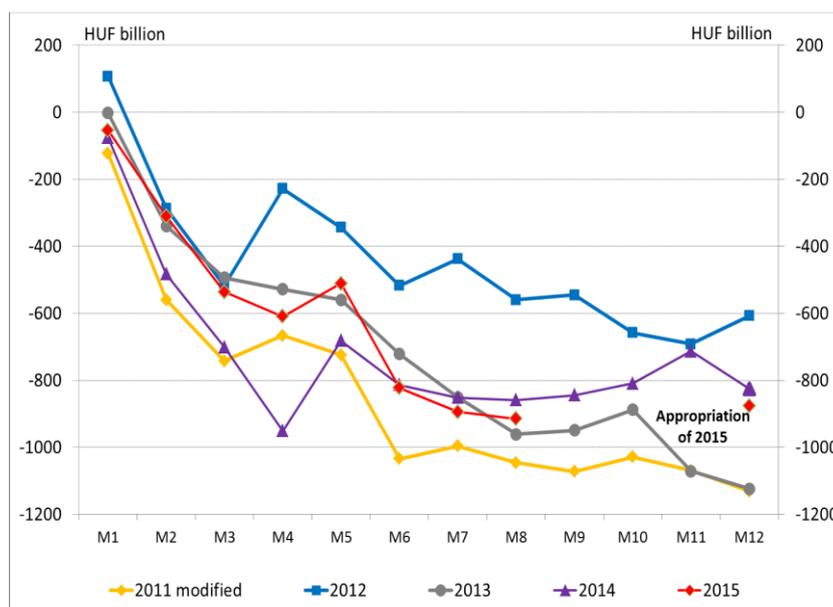

Source: MNB calculations based on CSO data.

**Inflation may remain low in the short term. The data received for August were slightly below our expectations described in the June Inflation Report, which is attributable to the subdued dynamics of the price index of fuels. Looking ahead, the inflation rate may turn out to be lower than formerly expected, due to the continued fall in oil prices.**

#### 1.4. Fiscal developments

**In August 2015, the central subsystem of the general government registered a deficit of HUF 21 billion, which exceeds the deficit recorded in August last year by HUF 14 billion. However, this deficit is HUF 60 billion more favourable than the average deficit of the same periods of the past three years (Chart 10). Favourable changes in the underlying trends continued in August as well, but EU funding was again significantly below the usual levels of the previous years.**

Chart 10: Intra-year cumulative balance of the state budget

Source: Hungarian State Treasury.

The revenues of the central subsystem in August 2015 were up by HUF 69 billion year on year. Most of the revenue surplus is attributable to higher revenues from VAT and excise tax in August. Expenditures of the central subsystem in August exceeded the 2014 base by nearly HUF 100 billion. The increase in expenditures is still mostly attributable to the growth in net expenditures of the budgetary institutions related to EU funding.

### 1.5. External balance

**According to the July data release, the seasonally unadjusted external financing capacity declined to EUR 1.1 billion, with surpluses of nearly EUR 800 million and more than EUR 300 million in the current and capital accounts, respectively.**

**Financing data indicate a much lower financing capacity amounting to a mere EUR 280 million. This financing capacity was the result of an increase in FDI inflows and a major decline in net external debt.** The structure of financing is different from that seen in previous months, when FDI outflows were significant due to dividend disbursements and the acquisition of Budapest Bank by the state. In July, net direct investments increased by EUR 220 million, with a higher reinvestment of incomes. Net external debt declined by nearly EUR 600 million, with higher debt repayment by the private sector and lower by the state.

## 2. FINANCIAL MARKETS

### 2.1. International financial markets

**There was some improvement in investor sentiment in the period following the previous interest rate decision. Although stock market volatility declined and the key stock exchange price indexes were able to rise slightly in both Europe and the United States, risk appetite continued to be less favourable compared to the period preceding the deterioration in sentiment at the end of August. There was no major change in developed market bond yields, while Central East European currencies slightly appreciated against the euro.**

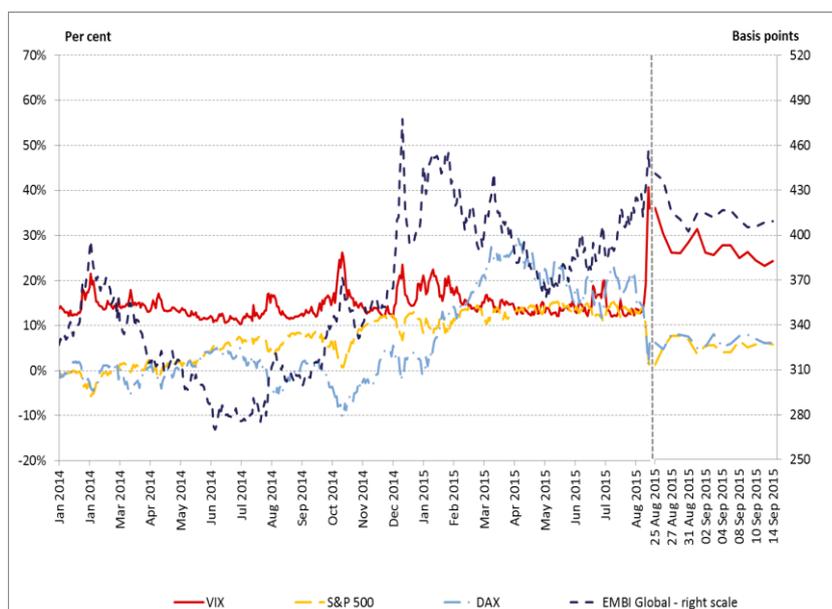

In parallel with a slight improvement in global risk appetite, risk indicators declined during the month. From the 50 points at the end of August, the VIX stock market volatility index fell to 21, while the EMBI Global Emerging Markets Bond Index fell from 475 to 420 basis points (Chart 11).

In the USA, although the picture of the economy as a whole shows improvement, labour market data continue to paint a somewhat contradictory picture. On the one hand, it is favourable that unemployment is at a low level of 5.1 per cent, and the number of those applying for unemployment benefit for the first time also stabilised below the level of 300 thousand. On the other hand, however, the activity rate had not been so low for several decades, and in August the increase in the number of non-agricultural employees was a negative surprise for the markets. Another problem is the extremely high number of part-time employees, and wage dynamics does not show any material improvement either. With regard to inflation, the PCE indicator, which is especially monitored by the Fed, continued to be very low (0.3 per cent in July), while the core PCE indicator has started a declining trend in recent months, standing at 1.2 per cent at present. Low oil prices pose a further downside risk to inflation, and according to decision-makers' forecast the achievement of the target may be postponed until 2018. **At its September rate-setting meeting the Fed** did not change the base rate. However, the majority of decision-makers continue to project a rise in the rate before the end of the year.

**Concerns about the economic growth of China also contributed to the remaining uncertainty** related to emerging markets. Although according to the data published during the month retail sales were in line with expectations in China, industrial production increased to a lesser extent, by 6.1 per cent in annual terms. Although the 5.5 per cent decline in exports is more favourable data than expected, the 13.8 per cent fall in imports was a serious negative surprise for the

markets. The Chinese statistical office made a downward revision of the 2014 GDP figure as well. Following a 25 per cent fall in August, the Shanghai stock exchange price index became stable during the month, and the exchange rate of the yuan also stopped depreciating. Overall, however, the state of the Chinese economy still remains in the focus of global investor attention.

*Chart 11: Developed market equity indices, the VIX index (left axis) and the EMBI Global Index (right axis)*

Source: Bloomberg.

After the world market price of oil had seemed to become stable in the spring months, another material fall started as of the end of June, which was supported by the end-of-August market uncertainty as well. As a result, the per-barrel price of the Brent crude oil had declined to USD 42 by the end of August. In the past one month, however, the price of oil became stable at a somewhat higher level, between USD 45–50, while the difference between Brent and WTI became close to USD 0. On the demand side, concerns with regard to the deceleration of the Chinese economy and concerns about the global economic activity, while on the supply side the ongoing extraction by the OPEC countries in excess of the quota, the Iran nuclear deal and the more efficient shale oil extraction by the United States contributed and are contributing to the decrease in oil prices, further supported by the strong dollar exchange rate.

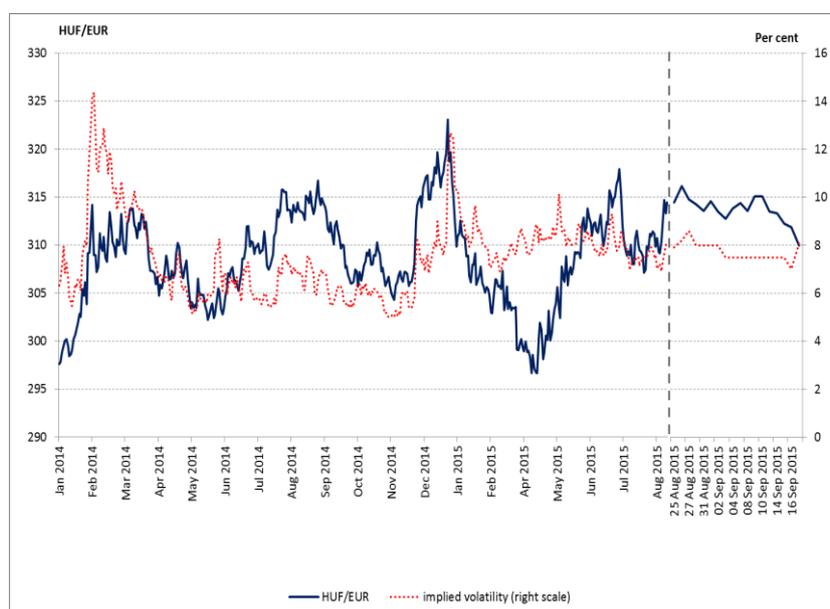

## 2.2. Developments in domestic money market indicators

**In line with the international trend, there was no major shift in the domestic market during the month.**

During the period, international news generated only moderate fluctuations in the domestic money market indicators, after markets had become stable following the end-of-August deterioration in sentiment. Country-specific news did not have a material impact on domestic market developments during the period either, while international markets mainly reflected the waiting for the US rate-setting decision. In the coming period, country-specific shift may result from the revision of Hungary's credit rating by the three major rating agencies in the autumn.

The forint market was characterised by trading within a narrow band; minor fluctuations were attributable to changes in international sentiment (Chart 12). The EUR/HUF exchange rate appreciated from above 314 at the beginning of the period up to 310, without major fluctuations. The Czech koruna was stable during the month, while the Romanian leu and the Polish zloty appreciated by around 0.5 per cent.

*Chart 12: EUR/HUF exchange rate and the implied volatility of exchange rate expectations*

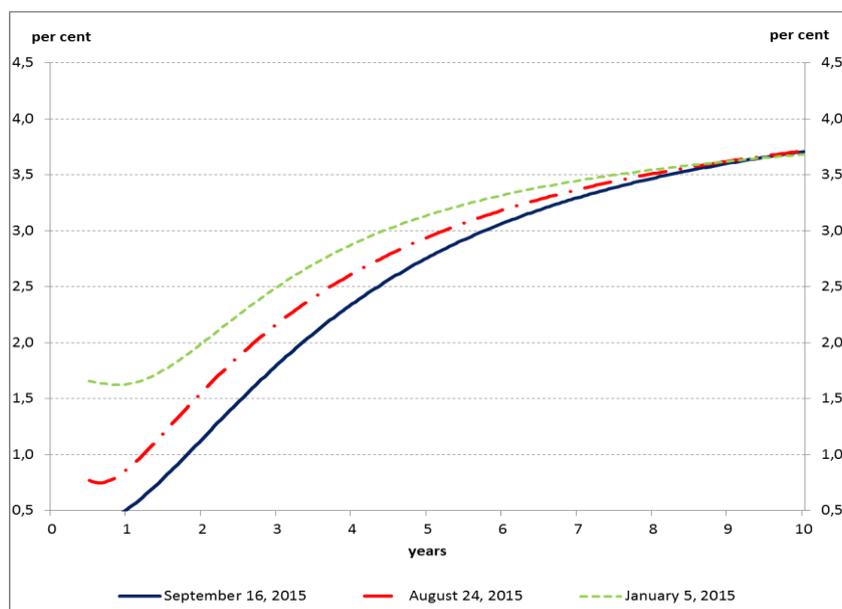

Source: Bloomberg.

**There was a downward shift in the government securities yield curve during the past one month; this shift was stronger in the short segment, and thus the yield curve became steeper (Chart 13). Government securities market benchmark yields up to one year declined by 30–40**

basis points, while an around 20 basis point decline took place in the 5–10-year segment. By this, the entire up-to-one-year section of the yield curve declined below 0.5 per cent, which is a new historical low. The 5-year yield level is around 2.5 per cent, while the 10-year one is around 3.5 per cent. The steepness of the Hungarian yield curve can be considered high in international comparison. However, it is worth noting that this is primarily the result of a stronger decline in short yields, while developments in the yields in the longer segment were practically in line with the regional trend, with a slight country-specific decline.

*Chart 13: Shifts in the spot government bond yield curve*

Sources: MNB, Reuters.

**During the period, strong demand was observed at the government securities auctions, while average auction yields continued to decline.** The debt manager faced 3–4-fold oversubscription in the case of 3-month and 5-year securities, and 2–3-fold oversubscription for 12-month securities. Oversubscription was even higher (5–7-fold) for 3-year securities. The Government Debt Management Agency (ÁKK) reacted to the high demand by increasing the offered quantity and the quantity issued within the framework of non-competitive auctions. Meanwhile, average auction yields continued to decline in parallel with the secondary market trend; securities were sold at an around 0.5 per cent yield level in the up-to-one-year segment.

**Following a gradual decline in the previous months, non-residents' government securities holdings increased by HUF 40 billion in September, standing around HUF 4,250 billion at present.** This value represents a ratio of 32 per cent within total market holdings amounting to

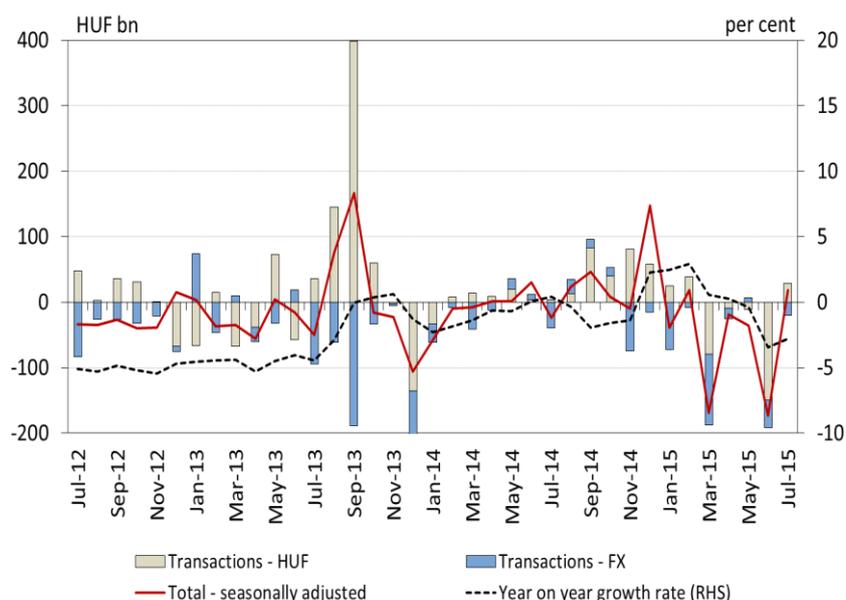

some HUF 13,000 billion. **The Hungarian 5-year CDS spread fell by 3 basis points during the month, standing around 165 basis points at present.**

### 3. TRENDS IN LENDING

In July, as a result of transactions, outstanding loans to non-financial corporations from the credit institutions sector increased by a total HUF 8 billion (seasonally adjusted by HUF 18 billion) (Chart 14). In terms of denomination, forint loans increased by some HUF 29 billion, while foreign currency loans fell by HUF 21 billion. The transaction-based annual growth rate of loans outstanding increased from minus 3.4 per cent in June to minus 2.8 per cent. Loans granted under Pillar I of the FGS contributed by around HUF 39 billion to corporate lending in July.

In July, in the case of newly granted corporate loans, the average interest rate on small-value forint loans declined by 0.24 percentage point to 4.41 per cent, but the average interest rate on higher-value forint loans increased by 0.28 percentage point to 2.77 per cent. As the result of the contrasting changes, the interest rate differential between small- and high-value new corporate loans declined again.

Chart 14: Net borrowing by non-financial corporations

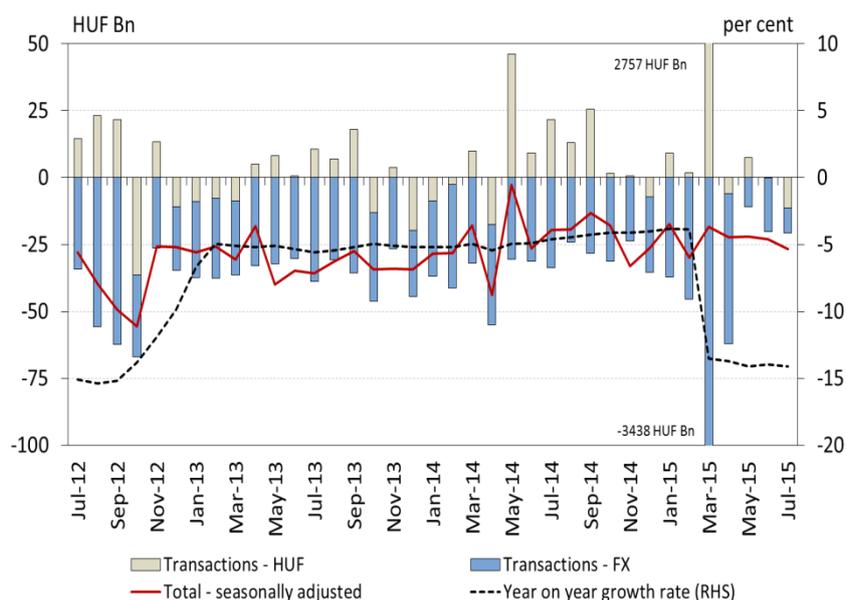

Source: MNB.

The moderate decline in outstanding loans continued in the household segment, representing a HUF 20.6 billion fall in terms of transactions in July (Chart 15). Outstanding forint and foreign currency loans declined by HUF 11.4 billion and HUF 9.2 billion, respectively, in the period under review. The volume of gross new loans lent by the entire sector of credit institutions to households amounted to HUF 70 billion in total, corresponding to an increase of 30 per cent year

on year. New housing, general purpose, personal and vehicle loans granted in July showed a strong increase in annual terms, while the issue of hire purchase and other loans remained practically unchanged compared to July 2014.

**Interest rates on new household loans declined slightly in July compared to the previous month.** The annual percentage rate of charge (APRC) on housing loans declined by 0.28 percentage point to 5.82 per cent, while the APRC on general purpose loans remained close to the level of the previous month (at 7.05 per cent).

*Chart 15: Net borrowing by households*
