

FLASH ANALYSIS OF INFLATION DEVELOPMENTS

OCTOBER

2023

Article 3 (1) of the Central Bank Act (Act CXXXIX of 2013 on the Magyar Nemzeti Bank) defines the achievement and maintenance of price stability as the Magyar Nemzeti Bank's primary objective. Assessments of inflation developments have key importance in monetary policy decision-making. The MNB attaches a high priority to informing the general public on a continuous basis and thereby to improving the transparency and predictability of its decisions. Consistent with this principle, the Magyar Nemzeti Bank produces publicly available analyses of its assessments of inflation developments and the extent of medium-term inflationary effects on a monthly basis.

The analysis has been prepared by the Economic Forecasts and Analysis Directorate and approved by Gergely Baksay, Executive Director for Economic Analysis and Competitiveness.

For further information, please contact Géza Rippel (e-mail: rippelg@mnb.hu)

The publicly available analyses and the related statistical databases are accessible on the MNB's website at:

ASSESSMENT OF INFLATION DATA FOR OCTOBER 2023

In October 2023, domestic inflation continued to decline at a fast pace. Consumer prices rose by 9.9 percent year on year. As a result, nine months after the peak in inflation at the beginning of the year, the growth rate of prices declined into one-digit territory again. Core inflation and core inflation excluding indirect tax effects fell to 10.9 percent (Chart 1 and Chart 2). The month-on-month, total consumer basket price was down by 0.1 percent as prices rose by 0.3 percent regarding core inflation.

The slowdown in inflation is still widely perceived, which is caused by the combined effect of the disciplined monetary policy, the government's steps to strengthen competition, the subdued demand environment, base effects and the external cost environment, which is significantly lower compared to last year. The October figures for both headline and core inflation were in the more favourable, lower half of the forecast range of the September Inflation Report.

Inflation slowed down by 2.3 percentage points compared to the previous month. This slowdown was largely driven by food prices (by -1.1 percentage point) and fuel prices (by -0.4 percentage point). Year-on-year core inflation fell by 2.2 percentage points, within which disinflation was widespread. The Bank's measures of underlying inflation developments capturing persistent inflationary trends, calculated on a year-on-year basis, also fell. The inflation of sticky-price products fell by 1.3 percentage point and the annual price rise of core inflation excluding processed food prices declined by 1.2 percentage point relative to the previous month (Chart 3).

The continued deceleration of underlying inflation is indicated by the fact that core inflation fell below 3 percent on a shorter-term base (3month/3month) (Chart 4). The price of the basket calculated excluding fuel and regulated product prices was up by 0.2 percent compared to the previous month (Chart 5). Month-on-month core inflation excluding processed food, which better reflect underlying developments, rose by 0.4 percent in October (Chart 6).

The trend seen in the past months in pricing patterns, continued. All product and service categories, excluding regulated products and services, the annual growth rate of prices moderated. In terms of both inflation and core inflation, the rate of price change compared to the previous month was below the historical average seen this time of year.

Below is a brief analysis of price changes across the main product categories.

The annual inflation of *tradables* fell to 8.8 percent. The prices of this product group rose by 0.4 percent compared to the previous month (Chart 7). Durables and non-durables prices rose by 0.1 percent and 0.6 percent relative to the previous month. The largest contributing factor to the latter was the rise in clothing prices, which is typically seen in the autumn months.

Market services prices rose by 0.4 percent on a monthly basis (Chart 8). Annual price index of market services declined to 14.3 percent; and as a result, the fall in annual price growth, started in June, continued.

According to HCSO data, the slowdown in *annual food* price inflation continued, as a result, it stood at 10.4 percent in October. Within the product group, the annual price indices of both processed and unprocessed food fell sharply (Chart 9). The fall in the inflation of unprocessed food prices was primarily caused by the decrease in egg, fresh vegetable and fruit prices, while the downtrend in processed food annual price dynamics was mainly explained by the decline in milk and dairy products as well as bread prices. Compared to September, unprocessed food prices and processed food prices decreased by 0.5 percent and 0.2 percent, respectively (Chart 10).

Fuel prices fell by 3.8 percent on a monthly basis, bringing the product group's annualised inflation down to 30.2 percent.

In the group of *alcohol* and *tobacco* products, prices was stagnant relative to September.

The prices of *regulated products and services* rose by 0.4 percent compared to September. The rise primarily reflects the 3.8 percent price growth of gambling.

The indicators, measuring *households' inflation expectations*, showed unusually high volatility (Chart 11). *Corporate expectations for retail sales and services prices* fluctuated at pre-Covid levels in October (Chart 12).

Chart 1 Consumer price index, core inflation and core inflation excluding indirect taxes
annual change

Note: Seasonally unadjusted core inflation.

Chart 2 Inflation decomposition
annual change

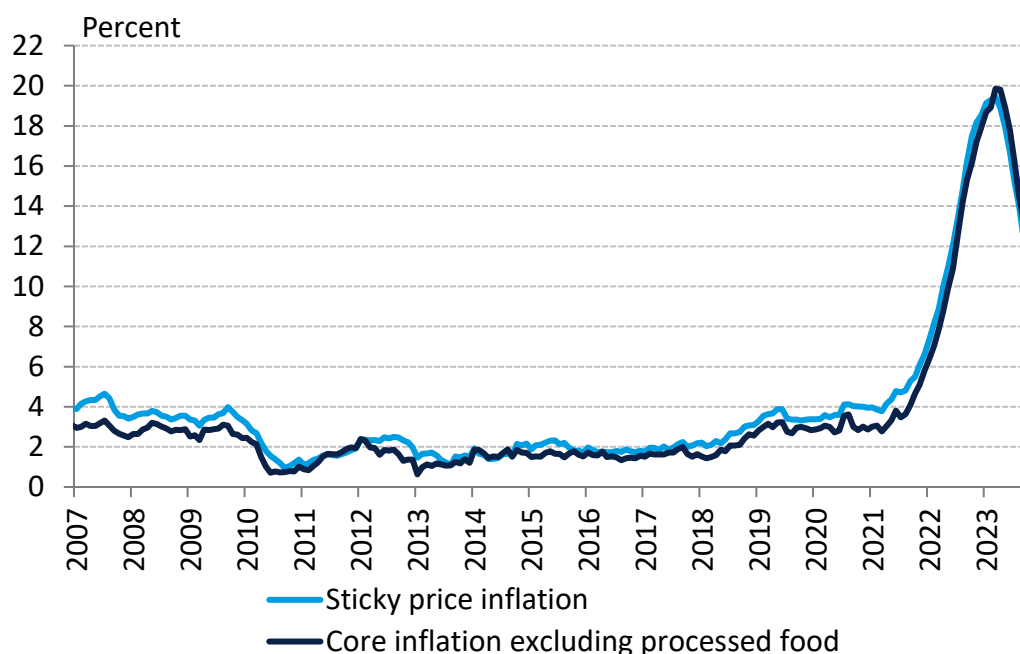

Chart 3 Underlying inflation indicators
annual percentage changes excluding indirect taxes

Note: Inflation of sticky-price products is composed of items of the consumer price index where maximum 15 percent of elementary prices change monthly on average. MNB calculation based on data released by the HCSO. Core inflation excluding processed foods with unchanged content is equivalent with the earlier demand sensitive inflation. The new name is justified by the fact that the previous name might be ambiguous in a period of significant cost shocks with general effects.

Chart 4 Three-month annualised change in inflation and core inflation
Based on seasonally adjusted data

Chart 5 Monthly changes in consumer prices excluding fuel and regulated products prices
tax-adjusted, seasonally unadjusted monthly percentage changes

Chart 6 Monthly change in core inflation excluding processed food
tax-adjusted, seasonally unadjusted monthly percentage changes

Chart 7 Inflation of tradable goods
seasonally unadjusted, tax-adjusted monthly change

Chart 8 Market services inflation
seasonally unadjusted, tax-adjusted monthly change

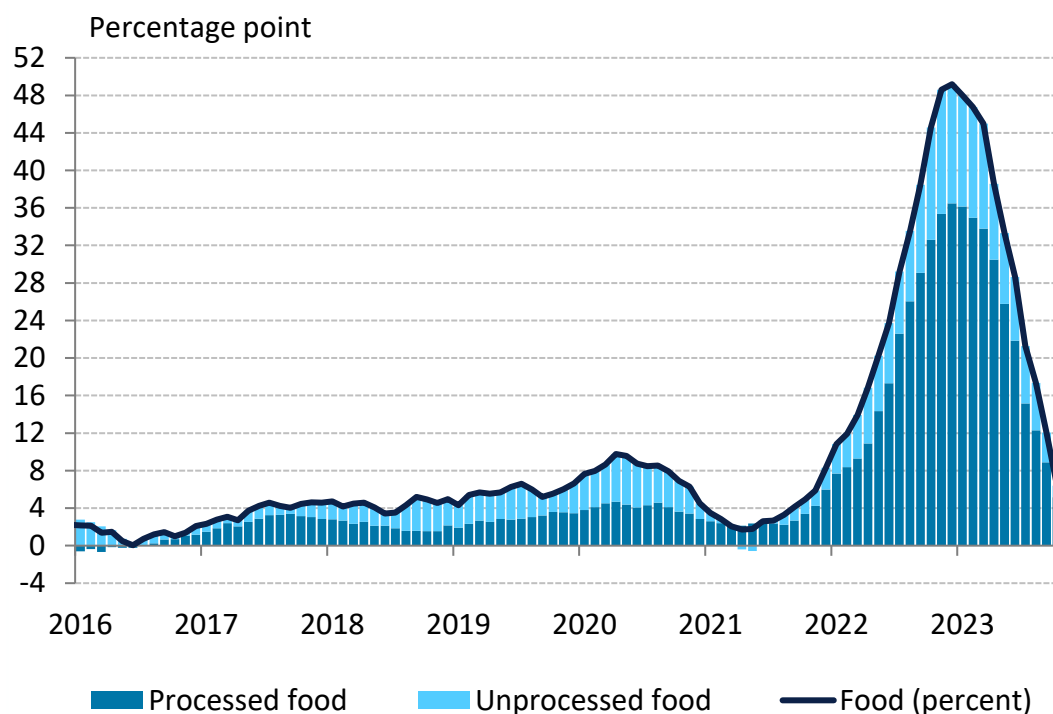

Chart 9 Developments in food price inflation
seasonally unadjusted, tax-adjusted annual change

Note: The difference in food price inflation calculated by the HCSO and the MNB is explained by methodological differences. The MNB classifies food-related services as market services (restaurant meals, workplace meals, canteen goods) and the prices of regulated goods and services (school meals, nursery and kindergarten meals), and some beverages as non-durable industrial goods (coffee, tea, soft drinks).

Chart 10 Monthly changes in food prices
seasonally unadjusted, tax-adjusted monthly change

Note: The difference in food price inflation calculated by the HCSO and the MNB is explained by methodological differences. The MNB classifies food-related services as market services (restaurant meals, workplace meals, canteen goods) and the prices of regulated goods and services (school meals, nursery and kindergarten meals), and some beverages as non-durable industrial goods (coffee, tea, soft drinks).
