

# MONTHLY ANALYSIS OF INFLATION DEVELOPMENTS

**FEBRUARY**

2021

*Article 3 (1) of the Central Bank Act (Act CXXXIX of 2013 on the Magyar Nemzeti Bank) defines the achievement and maintenance of price stability as the Magyar Nemzeti Bank's primary objective. Assessments of inflation developments have key importance in monetary policy decision-making. The MNB attaches a high priority to informing the general public on a continuous basis and thereby to improving the transparency and predictability of its decisions. Consistent with this principle, the Magyar Nemzeti Bank produces publicly available analyses of its assessments of inflation developments and the extent of medium-term inflationary effects on a monthly basis.*

*The analysis has been prepared by the Economic Forecasts and Analysis Directorate and approved by Gergely Baksay, Executive Director for Economic Analysis and Competitiveness.*

*For further information, please contact Judit Várhegyi (e-mail: [varhegyij@mnb.hu](mailto:varhegyij@mnb.hu))*

The publicly available analyses and the related statistical databases are accessible on the MNB's website at:

## ASSESSMENT OF INFLATION DATA FOR FEBRUARY 2021

In February 2021, annual *inflation* stood at 3.1 percent and core inflation at 4.1 percent. Core inflation adjusted for the effects of indirect taxes was 3.4 percent (Chart 1). Inflation rose by 0.4 percentage points and core inflation fell by 0.1 percentage point relative to the previous month. The rise in inflation reflected an increase in fuel prices.

The Bank's measures of underlying inflation developments capturing persistent inflationary trends, i.e. the price index for demand-sensitive products and the inflation of sticky-price products and services, fell relative to the previous month (Chart 2).

In February 2021, the contribution of demand-sensitive products to inflation remained unchanged. By contrast, the contribution of fuel rose into positive territory for the first time since February 2020 (Chart 3).

Pricing decisions showed higher volatility and an unusual seasonal pattern after the onset of the coronavirus pandemic. With disinflationary effects strengthening since September 2020, there was generally a weaker price growth in the last months of 2020. In the first months of 2021, repricing was below the level seen in 2020 (Chart 4).

Below is a brief analysis of price changes across the main product categories.

The annual inflation of *industrial goods* rose in February. Within the product group, durables price index rose relative to the previous month, and non-durables price index remained broadly unchanged. An increase in the inflation of durables partly reflected a general rise in prices within the product group, and the base effects of a decline in the prices of second-hand passenger cars.

*Market services* prices rose by 0.4 percent compared with the previous month (Chart 5). There were similar monthly price changes in a wide range of services to that of the average in recent years.

The inflation of *foods* continued to decline in February. Within the product group, the unprocessed food price index was mainly reduced by a fall in fresh vegetables prices, while more modest changes in processed meat product prices reduced the inflation of processed food.

Prices of *regulated products* were broadly unchanged relative to January.

*Fuel prices* rose as the world market price of oil increased relative to the previous month.

The indicators, measuring *households' inflation expectations*, showed unusually high volatility, similarly to the consumer price index. The indicator decreased in February compared to earlier months (Chart 6).

Prepared by Judit Várhegyi

Budapest, 9 March 2021

**Chart 1 Consumer price index, core inflation and core inflation excluding indirect taxes**  
(annual percentage changes, January 2007 – February 2021)

Note: Seasonally unadjusted core inflation.

**Chart 2 Underlying inflation indicators**

(excluding indirect taxes, annual percentage changes, January 2007 – February 2021)

Note: Demand-sensitive inflation is derived by eliminating processed food prices from core inflation. Inflation of sticky-price products is composed of items of the consumer price index where maximum 15 per cent of elementary prices change monthly on average. MNB calculation based on data released by the HCSO.
